

CribMaster DynaStock

The Dyna-Stock centers on a robot picker with different sized trays that are positioned in slots lining the internal walls. The robot picker pulls product and trays from the slots for issuing and also creates an easy to use, automatic restocking process.

The Dyna-Stock has the capability to handle storage trays in two different widths and different heights. The inventory and trays are placed into the unit by the restocking door and the robot takes care of the rest. It retrieves the tray, measures the heights, and then finds the best location. It adds ease and speed to restocking with minimal user interaction.

Not only does it have a storage capacity of 3000+, but some other benefits of the Dyna-Stock include:

An easy to use touch screen interface

Tracking with multi-category usage & accounting – Up to seven (6 user definable) classifications for tracking and reporting

Flexible automatic reordering & resupply to limit stock outs

Item issue security – limit access to prevent incorrect usage or unauthorized access

Item issue efficiency – improved productivity by issuing nearer to job sites with fast item issue speeds

Manufacturing efficiency help – machine usage is improved by minimizing downtimes because of inventory shortage

Eliminate stock-outs with features like critical alerts and automated optimum order levels

Manage durable items, serialized gages and test equipment

Eliminating time consumed by re-stocking, the Dyna-Stock works while you work

and more...
